Chapter 6

DENSITY OF SOLID – INORGANIC COMPOUNDS

Carl L. Yaws and Daniel H. Chen
Lamar University, Beaumont, Texas

Tabulation Results

The results are given in Table 6. The tabulation is arranged by alphabetical order (Ag, Al, Ar, ……, Zr) to provide ease of use in quickly locating the data by using the chemical formula. The compound name and CAS No (Chemical Abstracts Registry Number) are next provided. Values for representative temperature and density at the representative temperature are given in the adjacent columns. The next column provides the code for the tabulation.

In preparing the tabulation, a literature search was conducted to identify data source publications (1-15). Both experimental values for the property under consideration and parameter values for estimation of the property are included in the source publications. The publications were screened and copies of appropriate data were made. These data were then keyed into the computer to provide a database of values for compounds for which experimental data are available. The database also served as a basis to check the accuracy of the estimation methods. Upon completion of data collection, estimation of values for the remaining compounds was performed.

The compilations of CRC (1-2); Daubert and Danner (3); Landolt and Bornstein (6); and Yaws (14-15) were used extensively for solid density. Many of the estimates are based on extending the liquid density to the triple point (3).

Example

In an engineering analysis, the solid density is needed for calcium chloride (CaCl2) at 25 C. Determine the solid density of calcium chloride at this temperature.

Inspection of the tabulation for solid density yields:

density = 2.1516 g/ml

Chapter 7

ENTHALPY OF VAPORIZATION – ORGANIC COMPOUNDS

Carl L. Yaws and Marco A. Satyro*
Lamar University, Beaumont, Texas / *Virtual Materials Group, Calgary, Alberta

Tabulation Results

The results are given in Table 7. For the tabulation, a modified Watson equation was selected for enthalpy of vaporization as a function of temperature:

$$\Delta H_{vap} = A\,(1 - T/T_C)^n \qquad (7)$$

where ΔH_{vap} = enthalpy of vaporization, kjoule/mol
A, T_C, and n = regression coefficients for chemical compound
T = temperature, K

The tabulation is arranged by carbon number (C, C2, C3, ...) to provide ease of use in quickly locating the data by using the chemical formula. The compound name and CAS No (Chemical Abstracts Registry Number) are next provided. Values for regression coefficients are given in the adjacent columns. The temperature range for use is given in the next columns (TMIN and TMAX). The equation should not be used for temperatures outside this range. The next column provides the code for the tabulation. The last two columns provide a representative temperature and a value for enthalpy of vaporization at the representative temperature.

In preparing the tabulation, a literature search was conducted to identify data source publications (1-33). Both experimental values for the property under consideration and parameter values for estimation of the property are included in the source publications. The publications were screened and copies of appropriate data were made. These data were then keyed into the computer to provide a database of values for compounds for which experimental data are available. The database also served as a basis to check the accuracy of the estimation methods. Upon completion of data collection, estimation of values for the remaining compounds was performed.

The compilations of CRC (1-2), Daubert and Danner (3), TRC (11-12), and Yaws (15-33) were used extensively for enthalpy of vaporization. Estimates for enthalpy of vaporization at the boiling point were primarily based on the Kistiakowsky rule (9) and Riedel method (9). The Joback method (9) was used for estimating critical temperature.

A comparison of calculated and data values is shown in Figure 7 for a representative compound. The graph shows favorable agreement of equation and data.

Example

In an engineering analysis, the enthalpy of vaporization is needed for methyl chloride (CH3Cl) at 248.93 K. Determine the enthalpy of vaporization of methyl chloride at this temperature.

Substitution of the coefficients from the tabulation and temperature into the above equation yields:

$$HVAP = 32.5337\,(1-248.93/416.25)^{0.4520}$$

HVAP = 21.549 kjoule/mol

code: 1 - data, 2 - estimate

HVAP - enthalpy of vaporization, kjoule/mol

A, T_c, and n - regression coefficients of chemical compound

T- temperature, K

TMAX - maximum temperature, K

TMIN - minimum temperature, K

Chapter 8

ENTHALPY OF VAPORIZATION – INORGANIC COMPOUNDS

Carl L. Yaws and Marco A. Satyro*
Lamar University, Beaumont, Texas / *Virtual Materials Group, Calgary, Alberta

Tabulation Results

The results are given in Table 8. For the tabulation, a modified Watson equation was selected for enthalpy of vaporization as a function of temperature:

$$\Delta H_{vap} = A\,(1 - T/T_C)^n \qquad (8)$$

where ΔH_{vap} = enthalpy of vaporization, kjoule/mol
A, T_C, and n = regression coefficients for chemical compound
T = temperature, K

The tabulation is arranged by alphabetical order (Ag, Al, Ar, ..., Zr) to provide ease of use in quickly locating the data by using the chemical formula. The compound name and CAS No (Chemical Abstracts Registry Number) are next provided. Values for regression coefficients are given in the adjacent columns. The temperature range for use is given in the next columns (TMIN and TMAX). The equation should not be used for temperatures outside this range. The next column provides the code for the tabulation. The last two columns provide a representative temperature and a value for enthalpy of vaporization at the representative temperature.

In preparing the tabulation, a literature search was conducted to identify data source publications (1-35). Both experimental values for the property under consideration and parameter values for estimation of the property are included in the source publications. The publications were screened and copies of appropriate data were made. These data were then keyed into the computer to provide a database of values for compounds for which experimental data are available. The database also served as a basis to check the accuracy of the estimation methods. Upon completion of data collection, estimation of values for the remaining compounds was performed.

The compilations of CRC (1-2), Daubert and Danner (3), Lange's Handbook (8-9), web sites (18-20), and Yaws (21-35) were used extensively for enthalpy of vaporization. The Kistiakowsky rule (13) and Riedel method (13) were primarily used for estimates of enthalpy of vaporization at the boiling point. Estimates for critical temperature were primarily based on the Gates-Thodos metod (10) and Grosse equation (10).

For the inorganic compounds, most of the data for enthalpy of vaporization and critical temperature are only available for compounds with low boiling points. The data available for compounds with high boiling points (normal boiling points in the range of 1200 K and greater) is very meager. In the absence of data, the estimates for enthalpy of vaporization and critical temperature should be considered rough approximations for those compounds with very high normal boiling points and very high critical temperatures.

A comparison of calculated and data values is shown in Figure 8 for a representative compound. The graph shows favorable agreement of equation and data.

Example

In an engineering analysis, the enthalpy of vaporization is needed for nitrogen (N2) at 90.00 K. Determine the enthalpy of vaporization of nitrogen at this temperature.

Substitution of the coefficients from the tabulation and temperature into the above equation yields:

$$HVAP = 7.4905\,(1-90.00/126.20)^{0.3130}$$

HVAP = 5.067 kjoule/mol

code: 1 - data, 2 - estimate

HVAP - enthalpy of vaporization, kjoule/mol

A, T_c, and n - regression coefficients of chemical compound

T- temperature, K

TMAX - maximum temperature, K

TMIN - minimum temperature, K

Chapter 9

ENTHALPY OF VAPORIZATION AT BOILING POINT – ORGANIC COMPOUNDS

Carl L. Yaws and Prashant Bahadur
Lamar University, Beaumont, Texas

Tabulation Results

The results are given in Table 9 for enthalpy of vaporization at boiling point. The tabulation is arranged by carbon number (C, C2, C3, ...) to provide ease of use in quickly locating the data by using the chemical formula. The compound name and CAS No (Chemical Abstracts Registry Number) are next provided. The next columns provides the normal boiling point and the enthalpy of vaporization at the boiling point. The last column gives the code for the tabulation.

In preparing the tabulation, a literature search was conducted to identify data source publications (1-33). Both experimental values for the property under consideration and parameter values for estimation of the property are included in the source publications. The publications were screened and copies of appropriate data were made. These data were then keyed into the computer to provide a database of values for compounds for which experimental data are available. The database also served as a basis to check the accuracy of the estimation methods. Upon completion of data collection, estimation of values for the remaining compounds was performed.

The compilations of CRC (1-2), Daubert and Danner (3), TRC (11-12), and Yaws (15-33) were used extensively. Estimates for enthalpy of vaporization at the boiling point were primarily based on the Kistiakowsky rule (9) and Riedel method (9).

Example

In an engineering analysis, the enthalpy of vaporization is needed for carbon tetrachloride (CCl4) at the boiling point temperature of 349.79 K. Determine the enthalpy of vaporization of carbon tetrachloride at the boiling point.

Inspection of the tabulation provides the following:

HVAP = 29.840 kjoule/mol
